Recommendations_with_IBM

October 2, 2022

1 Recommendations with IBM

In this notebook, you will be putting your recommendation skills to use on real data from the IBM Watson Studio platform.

You may either submit your notebook through the workspace here, or you may work from your local machine and submit through the next page. Either way assure that your code passes the project RUBRIC. **Please save regularly.**

By following the table of contents, you will build out a number of different methods for making recommendations that can be used for different situations.

1.1 Table of Contents

I. Section **??** II. Section **??** III. Section **??** IV. Section **??** V. Section **??** VI. Section **??**

At the end of the notebook, you will find directions for how to submit your work. Let's get started by importing the necessary libraries and reading in the data.

```
In [64]: import pandas as pd
         import numpy as np
         import matplotlib.pyplot as plt
         import project_tests as t
         import pickle

         %matplotlib inline

         df = pd.read_csv('data/user-item-interactions.csv')
         df_content = pd.read_csv('data/articles_community.csv')
         del df['Unnamed: 0']
         del df_content['Unnamed: 0']

         # Show df to get an idea of the data
         df.head()
```

```
Out[64]:    article_id                                              title  \
         0      1430.0  using pixiedust for fast, flexible, and easier...
         1      1314.0       healthcare python streaming application demo
         2      1429.0         use deep learning for image classification
         3      1338.0          ml optimization using cognitive assistant
         4      1276.0          deploy your python model as a restful api
```

```
                                              email

1.1.1 Part I : Exploratory Data Analysis

Use the dictionary and cells below to provide some insight into the descriptive statistics of the data.

1. What is the distribution of how many articles a user interacts with in the dataset? Provide a visual and descriptive statistics to assist with giving a look at the number of times each user interacts with an article.

In [66]:
```
print(df.isnull().sum())
print(df_content.isnull().sum())
```

```
article_id     0
title          0
email         17
dtype: int64
doc_body           14
doc_description     3
```

```
doc_full_name       0
doc_status          0
article_id          0
dtype: int64
```

```
In [67]: df.groupby('email')['article_id'].describe(include='all')
```

Out[67]:

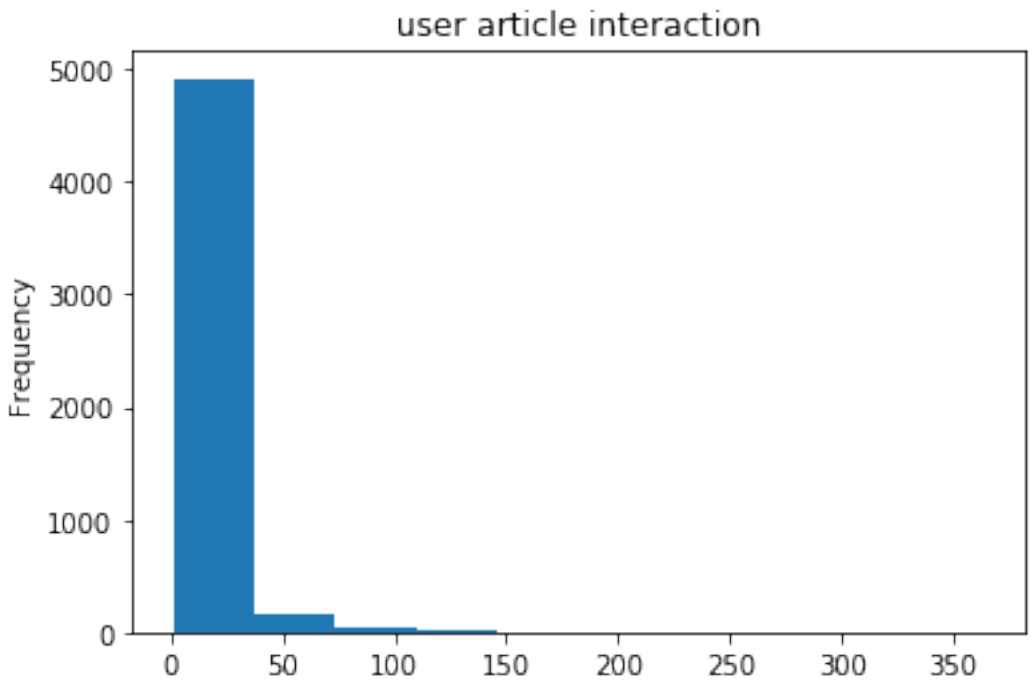
In [69]:
```
df.groupby('email')['article_id'].count().plot(kind="hist")
plt.title("user article interaction");
```



```
In [70]: print(df.groupby('email')['article_id'].count().median())
         print(df.groupby('email')['article_id'].count().max())
```

```
3.0
364
```

```
In [71]: # Fill in the median and maximum number of user_article interactios below
         # 50% of individuals interact with ____ number of articles or fewer
         median_val = df.groupby('email')['article_id'].count().median()
         #print('50% of individuals interact with {} number of article or fewer'.format(median_v
          # The maximum number of user-article interactions by any 1 user is ______.
         max_views_by_user =df.groupby('email')['article_id'].count().max()
         #print('The maximum number of user-article interactions by any 1 user is {}'.format(max
```

2. Explore and remove duplicate articles from the **df_content** dataframe.

```
In [72]: # Find and explore duplicate articles
         #print('Number of rows in the original df_content: {}'.format(df_content.shape[0]))
         #print('Number of duplicate articles: {}'.format(df_content.duplicated('article_id').su
```

```
In [73]: # Remove any rows that have the same article_id - only keep the first
         df_content = df_content.drop_duplicates('article_id', keep='first')
         df_content.shape
```

```
Out[73]: (1051, 5)
```

3. Use the cells below to find:

a. The number of unique articles that have an interaction with a user.

b. The number of unique articles in the dataset (whether they have any interactions or not). **c.** The number of unique users in the dataset. (excluding null values) **d.** The number of user-article interactions in the dataset.

```
In [74]: ## unique_articles = # The number of unique articles that have at least one interaction
         ## total_articles = # The number of unique articles on the IBM platform
         ## unique_users = # The number of unique users
         ## user_article_interactions = # The number of user-article interactions

In [75]: # The number of unique articles that have at least one interaction
         unique_articles = df[df.email.isnull() == False].article_id.nunique()
         # The number of unique articles in the dataset
         total_articles = df_content.article_id.nunique()
         # The number of unique users
         unique_users = df.email.nunique()
         # The number of user-article interactions in the dateset
         user_article_interactions = df.shape[0]
         #print('The number of unique articles that have at least one interaction: {}'.format(un
         #print('The number of unique articles on the IBM platform: {}'.format(total_articles))
         #print('The number of unique users: {}'.format(unique_users))
         #print('The number of user-article interactions: {}'.format(user_article_interactions))
```

4. Use the cells below to find the most viewed **article_id**, as well as how often it was viewed. After talking to the company leaders, the `email_mapper` function was deemed a reasonable way to map users to ids. There were a small number of null values, and it was found that all of these null values likely belonged to a single user (which is how they are stored using the function below).

```
In [76]: # The most viewed article in the dataset as a string with one value following the decim
         most_viewed_article_id =df[df.email.isnull() == False]['article_id'].value_counts()

         most_viewed_article_id=most_viewed_article_id.head(1).index.astype(str)
         most_viewed_article_id
         #most_viewed_article_id='1429.0'

Out[76]: Index(['1429.0'], dtype='object')

In [77]: # The most viewed article in the dataset was viewed how many times?
         max_views = df[df.email.isnull() == False].groupby('article_id')['email'].count().max()
         max_views

Out[77]: 937

In [78]: ## No need to change the code here - this will be helpful for later parts of the noteb
         # Run this cell to map the user email to a user_id column and remove the email column

         def email_mapper():
             coded_dict = dict()
```

```
    cter = 1
    email_encoded = []

    for val in df['email']:
        if val not in coded_dict:
            coded_dict[val] = cter
            cter+=1

        email_encoded.append(coded_dict[val])
    return email_encoded

email_encoded = email_mapper()
del df['email']
df['user_id'] = email_encoded

# show header
df.head()
```

```

```
It looks like you have everything right here! Nice job!
```

1.1.2 Part II: Rank-Based Recommendations

Unlike in the earlier lessons, we don't actually have ratings for whether a user liked an article or not. We only know that a user has interacted with an article. In these cases, the popularity of an

article can really only be based on how often an article was interacted with.

1. Fill in the function below to return the **n** top articles ordered with most interactions as the top. Test your function using the tests below.

```
In [80]: def get_top_articles(n, df=df):
             '''
             INPUT:
             n - (int) the number of top articles to return
             df - (pandas dataframe) df as defined at the top of the notebook

             OUTPUT:
             top_articles - (list) A list of the top 'n' article titles

             '''
             # Your code here
             articles_desc=df.groupby('title')['article_id'].count().sort_values(ascending=False
             top_articles=articles_desc.head(n).index
             return top_articles # Return the top article titles from df (not df_content)

         def get_top_article_ids(n, df=df):
             '''
             INPUT:
             n - (int) the number of top articles to return
             df - (pandas dataframe) df as defined at the top of the notebook

             OUTPUT:
             top_articles - (list) A list of the top 'n' article titles

             '''
             # Your code here
             article_id_desce=df['article_id'].value_counts().sort_values(ascending=False)
             top_articles_id=article_id_desce.head(n).index

             return top_articles_id # Return the top article ids

In [81]: print(get_top_articles(10))
         print(get_top_article_ids(10))

Index(['use deep learning for image classification',

```

```
Your top_5 looks like the solution list! Nice job.
Your top_10 looks like the solution list! Nice job.
Your top_20 looks like the solution list! Nice job.
```

1.1.3 Part III: User-User Based Collaborative Filtering

1. Use the function below to reformat the **df** dataframe to be shaped with users as the rows and articles as the columns.

- Each **user** should only appear in each **row** once.
- Each **article** should only show up in one **column**.
- **If a user has interacted with an article, then place a 1 where the user-row meets for that article-column**. It does not matter how many times a user has interacted with the article, all entries where a user has interacted with an article should be a 1.
- **If a user has not interacted with an item, then place a zero where the user-row meets for that article-column**.

Use the tests to make sure the basic structure of your matrix matches what is expected by the solution.

```
In [83]: # create the user-article matrix with 1's and 0's

         def create_user_item_matrix(df):
             '''
             INPUT:
             df - pandas dataframe with article_id, title, user_id columns

             OUTPUT:
             user_item - user item matrix

             Description:
             Return a matrix with user ids as rows and article ids on the columns with 1 values
```

```
        an article and a 0 otherwise
        '''
        df_new=df.pivot_table(index='user_id',columns='article_id', values='title', aggfunc
        df_new=df_new.replace(np.nan, 0)
        user_item=df_new.applymap(lambda x: 1 if x > 0 else x)
        #user_item=df.drop_duplicates().groupby(['user_id', 'article_id']).size().unstack()
        return user_item # return the user_item matrix

    user_item = create_user_item_matrix(df)
```

```
In [84]: ## Tests: You should just need to run this cell.  Don't change the code.
         assert user_item.shape[0] == 5149, "Oops!  The number of users in the user-article matr
         assert user_item.shape[1] == 714, "Oops!  The number of articles in the user-article ma
         assert user_item.sum(axis=1)[1] == 36, "Oops!  The number of articles seen by user 1 do
         print("You have passed our quick tests!  Please proceed!")
```

```
You have passed our quick tests!  Please proceed!
```

2. Complete the function below which should take a user_id and provide an ordered list of the most similar users to that user (from most similar to least similar). The returned result should not contain the provided user_id, as we know that each user is similar to him/herself. Because the results for each user here are binary, it (perhaps) makes sense to compute similarity as the dot product of two users.

Use the tests to test your function.

```
In [85]: def find_similar_users(user_id, user_item=user_item):
             '''
             INPUT:
             user_id - (int) a user_id
             user_item - (pandas dataframe) matrix of users by articles:
                         1's when a user has interacted with an article, 0 otherwise

             OUTPUT:
             similar_users - (list) an ordered list where the closest users (largest dot product
                             are listed first

             Description:
             Computes the similarity of every pair of users based on the dot product
             Returns an ordered

             '''
             # compute similarity of each user to the provided user

             user_item = pd.DataFrame(user_item)

             user_similarity = user_item.dot(np.transpose(user_item))

             # sort by similarity
```

```
    user_similarity = user_similarity.sort_values(by=user_id, ascending=False)

    # remove the own user's id

    user_similarity.drop(user_id, axis=0, inplace=True)

    # create list of just the ids

    most_similar_users = list(user_similarity.index)

    return most_similar_users # return a list of the users in order from most to least
```

```
In [86]: # Do a spot check of your function
         print("The 10 most similar users to user 1 are: {}".format(find_similar_users(1)[:10]))
         print("The 5 most similar users to user 3933 are: {}".format(find_similar_users(3933)[:
         print("The 3 most similar users to user 46 are: {}".format(find_similar_users(46)[:3]))
```

```
The 10 most similar users to user 1 are: [3933, 23, 3782, 203, 4459, 3870, 131, 4201, 46, 5041]
The 5 most similar users to user 3933 are: [1, 23, 3782, 203, 4459]
The 3 most similar users to user 46 are: [4201, 3782, 23]
```

3. Now that you have a function that provides the most similar users to each user, you will want to use these users to find articles you can recommend. Complete the functions below to return the articles you would recommend to each user.

```
In [87]: user_item.head()
```

```
Out[87]: article_id  0.0     2.0     4.0     8.0     9.0     12.0    14.0    15.0    \
         user_id
         1              0.0     0.0     0.0     0.0     0.0     0.0     0.0     0.0
         2              0.0     0.0     0.0     0.0     0.0     0.0     0.0     0.0

```
If this is all you see, you passed all of our tests!  Nice job!
```

4. Now we are going to improve the consistency of the **user_user_recs** function from above.

- Instead of arbitrarily choosing when we obtain users who are all the same closeness to a given user - choose the users that have the most total article interactions before choosing those with fewer article interactions.
- Instead of arbitrarily choosing articles from the user where the number of recommended articles starts below m and ends exceeding m, choose articles with the articles with the most total interactions before choosing those with fewer total interactions. This ranking should be what would be obtained from the **top_articles** function you wrote earlier.

```
In [91]: def get_top_sorted_users(user_id, df=df, user_item=user_item):
             '''
             INPUT:

5. Use your functions from above to correctly fill in the solutions to the dictionary below. Then test your dictionary against the solution. Provide the code you need to answer each following the comments below.

```
In [93]: ### Tests with a dictionary of results

         user1_most_sim = get_top_sorted_users(1).iloc[0]['neighbor_id']# Find the user that is
         #print(user1_most_sim)
         user131_10th_sim = get_top_sorted_users(131).iloc[9]['neighbor_id']# Find the 10th most
         #print(user131_10th_sim)

In [94]: ## Dictionary Test Here
         sol_5_dict = {
             'The user that is most similar to user 1.': user1_most_sim,
             'The user that is the 10th most similar to user 131': user131_10th_sim,
         }

         t.sol_5_test(sol_5_dict)

This all looks good!  Nice job!
```

6. If we were given a new user, which of the above functions would you be able to use to make recommendations? Explain. Can you think of a better way we might make recommendations? Use the cell below to explain a better method for new users.

Provide your response here.

7. Using your existing functions, provide the top 10 recommended articles you would provide for the a new user below. You can test your function against our thoughts to make sure we are all on the same page with how we might make a recommendation.

```
In [95]: new_user = '0.0'

         # What would your recommendations be for this new user '0.0'?  As a new user, they have
         # Provide a list of the top 10 article ids you would give to
         new_user_recs =  [str(id) for id in get_top_article_ids(10)] # Your recommendations her

In [96]: assert set(new_user_recs) == set(['1314.0','1429.0','1293.0','1427.0','1162.0','1364.0'

         print("That's right!  Nice job!")

That's right!  Nice job!
```

1.1.4 Part IV: Content Based Recommendations (EXTRA - NOT REQUIRED)

Another method we might use to make recommendations is to perform a ranking of the highest ranked articles associated with some term. You might consider content to be the **doc_body**, **doc_description**, or **doc_full_name**. There isn't one way to create a content based recommendation, especially considering that each of these columns hold content related information.

1. Use the function body below to create a content based recommender. Since there isn't one right answer for this recommendation tactic, no test functions are provided. Feel free to change the function inputs if you decide you want to try a method that requires more input values. The input values are currently set with one idea in mind that you may use to make content based

recommendations. One additional idea is that you might want to choose the most popular recommendations that meet your 'content criteria', but again, there is a lot of flexibility in how you might make these recommendations.

1.1.5 This part is NOT REQUIRED to pass this project. However, you may choose to take this on as an extra way to show off your skills.

```
In [97]: def make_content_recs():
             '''
             INPUT:

             OUTPUT:

             '''
```

2. Now that you have put together your content-based recommendation system, use the cell below to write a summary explaining how your content based recommender works. Do you see any possible improvements that could be made to your function? Is there anything novel about your content based recommender?

1.1.6 This part is NOT REQUIRED to pass this project. However, you may choose to take this on as an extra way to show off your skills.

Write an explanation of your content based recommendation system here.

3. Use your content-recommendation system to make recommendations for the below scenarios based on the comments. Again no tests are provided here, because there isn't one right answer that could be used to find these content based recommendations.

1.1.7 This part is NOT REQUIRED to pass this project. However, you may choose to take this on as an extra way to show off your skills.

```
In [98]: # make recommendations for a brand new user

         # make a recommendations for a user who only has interacted with article id '1427.0'
```

1.1.8 Part V: Matrix Factorization

In this part of the notebook, you will build use matrix factorization to make article recommendations to the users on the IBM Watson Studio platform.

1. You should have already created a **user_item** matrix above in **question 1** of **Part III** above. This first question here will just require that you run the cells to get things set up for the rest of **Part V** of the notebook.

```
In [99]: # Load the matrix here
         user_item_matrix = pd.read_pickle('user_item_matrix.p')

In [100]: # quick look at the matrix
          user_item_matrix.head()
```

```
Out[100]: article_id  0.0  100.0  1000.0  1004.0  1006.0  1008.0  101.0  1014.0  1015.0  \
          user_id
          1           0.0    0.0     0.0     0.0     0.0     0.0    0.0     0.0     0.0
          2           0.0    0.0     0.0     0.0     0.0     0.0    0.0     0.0     0.0
          3           0.0    0.0     0.0     0.0     0.0     0.0    0.0     0.0     0.0
          4           0.0    0.0     0.0     0.0     0.0     0.0    0.0     0.0     0.0
          5           0.0    0.0     0.0     0.0     0.0     0.0    0.0     0.0     0.0

          article_id  1016.0  ...    977.0  98.0  981.0  984.0  985.0  986.0  990.0  \
          user_id             ...
          1              0.0  ...      0.0   0.0    1.0    0.0    0.0    0.0    0.0
          2              0.0  ...      0.0   0.0    0.0    0.0    0.0    0.0    0.0
          3              0.0  ...      1.0   0.0    0.0    0.0    0.0    0.0    0.0
          4              0.0  ...      0.0   0.0    0.0    0.0    0.0    0.0    0.0
          5              0.0  ...      0.0   0.0    0.0    0.0    0.0    0.0    0.0

          article_id  993.0  996.0  997.0
          user_id
          1             0.0    0.0    0.0
          2             0.0    0.0    0.0
          3             0.0    0.0    0.0
          4             0.0    0.0    0.0
          5             0.0    0.0    0.0

          [5 rows x 714 columns]
```

2. In this situation, you can use Singular Value Decomposition from numpy on the user-item matrix. Use the cell to perform SVD, and explain why this is different than in the lesson.

```
In [101]: # Perform SVD on the User-Item Matrix Here

          u, s, vt = np.linalg.svd(user_item_matrix)# use the built in to get the three matrices
```

Provide your response here.

3. Now for the tricky part, how do we choose the number of latent features to use? Running the below cell, you can see that as the number of latent features increases, we obtain a lower error rate on making predictions for the 1 and 0 values in the user-item matrix. Run the cell below to get an idea of how the accuracy improves as we increase the number of latent features.

```
In [102]: num_latent_feats = np.arange(10,700+10,20)
          sum_errs = []

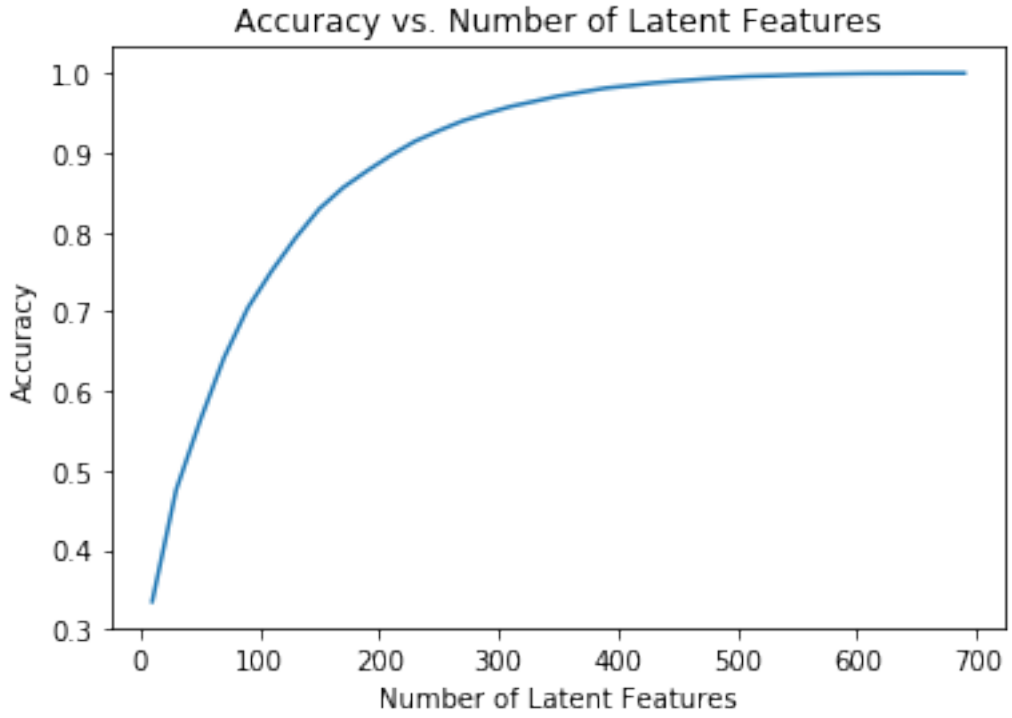
          for k in num_latent_feats:
              # restructure with k latent features
              s_new, u_new, vt_new = np.diag(s[:k]), u[:, :k], vt[:k, :]

              # take dot product
              user_item_est = np.around(np.dot(np.dot(u_new, s_new), vt_new))
```

```
    # compute error for each prediction to actual value
    diffs = np.subtract(user_item_matrix, user_item_est)

    # total errors and keep track of them
    err = np.sum(np.sum(np.abs(diffs)))
    sum_errs.append(err)

plt.plot(num_latent_feats, 1 - np.array(sum_errs)/df.shape[0]);
plt.xlabel('Number of Latent Features');
plt.ylabel('Accuracy');
plt.title('Accuracy vs. Number of Latent Features');
```



4. From the above, we can't really be sure how many features to use, because simply having a better way to predict the 1's and 0's of the matrix doesn't exactly give us an indication of if we are able to make good recommendations. Instead, we might split our dataset into a training and test set of data, as shown in the cell below.

Use the code from question 3 to understand the impact on accuracy of the training and test sets of data with different numbers of latent features. Using the split below:

- How many users can we make predictions for in the test set?

- How many users are we not able to make predictions for because of the cold start problem?
- How many articles can we make predictions for in the test set?

- How many articles are we not able to make predictions for because of the cold start problem?

```
In [103]: df_train = df.head(40000)
          df_test = df.tail(5993)

          def create_test_and_train_user_item(df_train, df_test):
              '''
              INPUT:

Awesome job!  That's right!  All of the test movies are in the training data, but there are only
```

5. Now use the **user_item_train** dataset from above to find U, S, and V transpose using SVD. Then find the subset of rows in the **user_item_test** dataset that you can predict using this matrix decomposition with different numbers of latent features to see how many features makes sense to keep based on the accuracy on the test data. This will require combining what was done in questions 2 - 4.

Use the cells below to explore how well SVD works towards making predictions for recommendations on the test data.

```
In [111]: # fit SVD on the user_item_train matrix
          u_train, s_train, vt_train = np.linalg.svd(user_item_train) # fit svd similar to above

          u_train.shape, s_train.shape, vt_train.shape
```

```
Out[111]: ((4487, 4487), (714,), (714, 714))

In [112]: # Use these cells to see how well you can use the training
          # decomposition to predict on test data

In [113]: common_rows = user_item_train.index.isin(test_idx)
          common_cols = user_item_train.columns.isin(test_arts)

          u_test = u_train[common_rows, :]
          s_test = s_train
          vt_test = vt_train[:, common_cols]

          u_test.shape, s_test.shape, vt_test.shape

Out[113]: ((20, 4487), (714,), (714, 574))

In [114]: train_idx = user_item_train.index
          common_idx = user_item_test.index.isin(train_idx)

6. Use the cell below to comment on the results you found in the previous question. Given the circumstances of your results, discuss what you might do to determine if the recommendations you make with any of the above recommendation systems are an improvement to how users currently find articles?

Your response here.

Extras Using your workbook, you could now save your recommendations for each user, develop a class to make new predictions and update your results, and make a flask app to deploy your results. These tasks are beyond what is required for this project. However, from what you learned in the lessons, you certainly capable of taking these tasks on to improve upon your work here!

1.2 Conclusion

Congratulations! You have reached the end of the Recommendations with IBM project!

Tip: Once you are satisfied with your work here, check over your report to make sure that it is satisfies all the areas of the rubric. You should also probably remove all of the "Tips" like this one so that the presentation is as polished as possible.

1.3 Directions to Submit

Before you submit your project, you need to create a .html or .pdf version of this notebook in the workspace here. To do that, run the code cell below. If it worked correctly, you should get a return code of 0, and you should see the generated .html file in the workspace directory (click on the orange Jupyter icon in the upper left).

Alternatively, you can download this report as .html via the **File** > **Download as** submenu, and then manually upload it into the workspace directory by clicking on the orange Jupyter icon in the upper left, then using the Upload button.

Once you've done this, you can submit your project by clicking on the "Submit Project" button in the lower right here. This will create and submit a zip file with this .ipynb doc and the .html or .pdf version you created. Congratulations!

```
In [117]: from subprocess import call
          call(['python', '-m', 'nbconvert', 'Recommendations_with_IBM.ipynb'])
```

```
